(ap biology edition) Ap Bio Cellular Respiration Study

Cellular Respiration is a chemical process with the following equation:  $C_6H_{12}O_6 + O_2 \rightarrow H_2O + CO_2$ . All organisms, including those capable of photosynthesis, go through the process of cellular respiration. The overall reaction breaks down a carbohydrate, most frequently modeled by glucose, and converts the energy stored in that molecule into the most basic

cellular energy, ATP.

## Cellular Respiration | Unit 3: Cellular Energetics - AP

...

Adenosine triphosphate (ATP) is the main product of cellular respiration, and the molecular energy of the cell. Aerobic metabolism results in a much higher yield of these energy carrying molecules due to the fact that it can use oxygen as a final electron acceptor in the electron transport chain.

inner membrane of mitochondria FADH<sub>2</sub> and NADH transfer their electrons to the ETC. The electrons pass down a series of proteins, pumping out H<sup>+</sup> atoms every time they go down a level. The Electron finally stops when it reaches Oxygen (the last electron receptor) and water is produced.
